

ROVER

- ▶ A portable system measuring emissions and vehicle and engine operating parameters
- ▶ Allows real time measurement over the full operating range of typical in-use operation
- ▶ Particularly helpful in emission testing heavy-duty highway and non-road engines where high cost limits dynamometer testing
- ▶ Develop as a routine source of in-use data for modeling/inventory assessment and as a screening tool for emission compliance
- ▶ Make available to states and others to help generate data and improve understanding of in-use emissions
